

TRIKE BOARD (SIDE-13)

How to Play Trike

Designed by Alek Erickson (2020) • Combinatorial abstract

Players

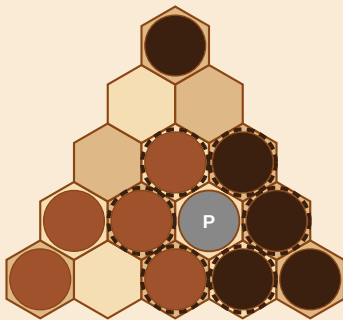

Two players. One plays white checkers, the other plays black checkers. A single neutral pawn is shared.

Setup

Use the board on the previous page. Each player needs their own colored checkers plus one shared neutral pawn.

Goal

Trap the pawn. When no legal move is possible, each player scores 1 point for every checker of their own color that is adjacent to — or sitting under — the pawn. The player with the higher score wins.

Pawn trapped — White scores the lighter dotted cells, Black scores the darker ones.

How to play

On your turn, move the pawn any number of empty cells in a straight line in any of the six axial directions. The pawn cannot pass over or land on an occupied cell. When you move the pawn, place a checker of your own color on the destination cell, then move the pawn on top of it.

Pie rule (recommended for fairness)

Player 1 makes the opening move. Player 2 may then either make a normal move, or swap sides and take the opening position. The pie rule cancels the first-move advantage. Board sizes 7–10 suit learning; 13–15 are standard for serious play; 7–19 are supported.

Coordinate notation

Cells use axial coordinates (q, r). A cell's address is the pair q,r, e.g. "3,1". The triangle's three vertex cells are (0, 0), (N–1, 0), and (0, N–1).
